

# Structural Ruralism: Exploring Innovative Strategies to Improve Rural Food Security and Access to Health Services

## Background

Rural communities face higher rates of hunger than urban areas, and experience unique challenges that contribute to food insecurity, including transportation barriers, lower wages, higher rates of under- and unemployment and limitations on accessing groceries stores and affordable nutritious foods. With respect to health consequences, hunger and food insecurity are associated with diabetes, obesity (primarily among women), hypertension, pregnancy complications, and depression, and national health costs of hunger and food security have been estimated at \$160B.

Maine is one of the most rural states in the U.S., with 61 percent of the population – over 3× the national average state percentage and, in Maine, equaling 830,000 people – living in rural areas. In Maine, one in eight people and one in six children face hunger. With respect to health resources, health professional shortage areas have been designated in 15 of the State’s 16 counties in primary care, mental health and/or dental health. The confluence of these factors suggest that there is unmet need in rural Maine with respect to food security and health access. Critically, and often invisibly, as well, one in six seniors in Maine also experience food insecurity and only 60% of seniors eligible for Supplemental Nutrition Assistance Program (SNAP) benefits in Maine access these resources.

With respect to advancing **health equity**, the term Structural Urbanism has been coined to describes implicit bias in how we think about health service provision in the U.S. In brief, if one’s focus on community health is urban-oriented, it makes sense to think about centralizing services so that people come to services (e.g., clinics, markets, food pantries). Within this framework, it will always be inefficient to ‘provide health’ in rural areas because population densities are too low for cost effectiveness.

We are interested in examining infrastructural needs for supporting food security, nutrition and health in rural areas under-evaluated via the lens of Structural Urbanism. Contextually, this means evaluating: how rural is defined and why the definition matters; strategies and limitations on rural food availability for purchase (retail, direct-to-consumer, delivery); rural infrastructure (internet access, road coverage, services available for grocery distribution and delivery and/or medical coverage and access; food storage infrastructure); rural food procurement via gardening, fishing, hunting, trapping, and trade; rural emergency food assistance options and access strategies; and evaluation of **Social Determinants of Health** frameworks in rural areas.

## Principal Project Team (Co-PIs)

The project team represents an interdisciplinary consortium including Food Studies at University of Southern Maine (USM); and the Colleges of Engineering and Nursing at University of Maine, Orono (UMaine). Co-Principal Investigators for this project are:

Jamie Picardy, PhD - USM - Food Studies

Karen Merritt, PhD, MPH - UMaine - Civil and Environmental Engineering (adjunct)

Kathryn Robinson, PhD, MHA/Ed., RN - UMaine – Nursing

## **Project Research Questions**

- How is rural defined and understood? Does this definition limit or render invisible rural needs?
- What innovative solutions in healthcare and business are practiced to reach rural communities and/or low income individuals?
- How can we adapt such practices to address food insecurity and increase health resiliency in rural Maine?
- What infrastructure is needed to develop a network of solutions? What barriers need to be addressed?

## **Focus Population and Needs**

Our project focus is District 2 of Maine. District 2 is the largest Federal congressional district east of the Mississippi River, comprises approximately 80% of the land area of the State and contains the second highest percent (80%) rural population by District in the U.S. To anticipate, adapt to and influence the future of rural health in Maine, current status and trends that require interdisciplinary evaluation include: changing State demographics (aging population, growth in immigrant communities throughout the State); the need for broadband expansion into rural Maine (internet and cellular) and associated local difficulties in fully utilizing potential for online food purchasing and food delivery; and changing health care delivery and service models (telehealth, mobile health).

## **Hypothesis with Assumptions**

H1: Structural access barriers limit food security and health in rural Maine. Through multidisciplinary focus on the underlying social and technical issues, unmet needs with respect to food security, nutrition and health can be identified and constructively addressed.

Importantly, we recognize that rural looks different in different parts of the U.S. Our focus is on identifying key barriers to access in one of the most rural areas of the U.S. and designing a roadmap – literally and metaphorically – to remove these barriers. Our research team backgrounds/expertise include nursing, food systems, and public health engineering. Our research team community connections include non-profit organizations, research institutes and direct service providers focused on food security (including provision of culturally appropriate foods), community health and wraparound services in rural areas in the State. Potential community partner organizations with whom we are currently either individually or collaboratively engaged include:

### **Public Health**

- Maine Rural Health Research Center
- Maine Public Health Association
- Wabanaki Reach and Wabanaki Public Health
- Healthy Acadia
- Healthy Communities of the Capital Area
- Maine Mobile Health
- UMaine Orono - Healthcare Nursing Program Partners

### **Food Security and Nutrition**

- Good Shepherd Food Bank
- Maine Network of Community Food Councils

- Maine Snap-Ed at the University of New England
- Good Food Bus | St. Mary's Nutrition Center (Androscoggin County, ME)
- Magic Food Bus | Healthy Peninsula (Hancock County, ME)
- Mano en Mano (Washington County, ME)

Policy

- Maine Food Policy

**Activities Supported by this Grant**

**Year 1: Examine Existing Frameworks, Limitations & Opportunities for Rural Services Access**

- P1: Definitions, challenges, and barriers that create or perpetuate health disparities in rural areas
- O1: Draft policy paper exploring Structural Ruralism as approach to rural service provision
- O2: Identification and outreach to existing service provision programs in Maine focused on rural and/or public health, nutrition and rural policy to engage with for implementation ideas

**Year 2: Determine Resource Potential & Identify Case Study Test/Site or Pilot Program**

- P1: Identify a case study test or pilot program for demonstration of innovation
- O1: Working with community partners, finalize Structural Ruralism policy paper
- O2: Create framework for implementing case study test or expansion of existing program as pilot

**Years 3 & 4: Implement a Pilot Project**

- O1: Model/case study/ demonstration that builds on an existing program;; possible strategies:
  - Broaden service area and/or extend seasonal distribution in areas serviced by mobile food provision programs;
  - Include nutritionist, SNAP or other social services support and/or public health nursing student in mobile medical service provision.
- O2: Roadmap the strategy for service provision - what is required to make it sustainable?
- O3: Roadmap the strategy for coop/service hours/practicum engagements (e.g., nursing)

**Year 5: Final Deliverables**

- O1: Program review/exploration of how results can be implemented elsewhere in the rural US.

**Budget Summary**

<b>Year</b>	<b>Budget</b>
Y1	\$50K
Y2	\$50K
Y3	\$150K
Y4	\$150K
Y5	\$70K

Personnel (30%); Direct Costs (15%); Indirect Costs (30%); Community Partners (25%)
